System Requirements

JobLine G-Code for VS Code 0.3.12

A VS Code extension: it runs inside the editor on your own computer and needs no JobLine account, server, or licence key. Program contents are not sent to JobLine.

Hardware Type	Requirement
Host application	Visual Studio Code **1.85 or newer** (desktop)*
Processor	1.6 GHz or faster, 64-bit (VS Code recommendation)**
Memory	1 GB for VS Code itself**. STEP import adds the OpenCascade WASM heap: 28.6 MB at start, grows on demand up to 2 GB†
Graphics	WebGL 2 with hardware acceleration enabled in VS Code (3D toolpath visualizer and tool preview use three.js r183)‡
Storage	VS Code: under 500 MB on disk**. Largest extension component: OpenCascade kernel `occt-import-js.wasm`, 7.6 MB
Network	None required. Optional links (Marketplace review, G-Code Academy) open only when selected. In draft PR #9: CAM output-folder watching reads only the local or network folders you add (`jobline.cam.watchFolders`); nothing is uploaded
Ports / devices	None. In draft PR #9 the CAM integrations are file-based: no connection to ESPRIT, Mastercam, Fusion or another CAM session, and no vendor SDK or CAM licence is needed

Operating System Requirements
Windows 10 / 11, 64-bit (supported Windows client versions)**
macOS versions that still receive Apple security updates (usually the latest and two previous)**
Linux: Ubuntu Desktop 20.04+, Debian 10+, RHEL 8+, Fedora 36+ (GLIBC 2.28+, GLIBCXX 3.4.25+)**
Not supported: VS Code for the Web (vscode.dev / github.dev). The extension ships only a desktop `main` entry, no `browser` entry

Licensing

Item	Requirement
Licence	MIT licence. No licence server, activation, dongle or sign-in
Distribution	VS Code Marketplace (WeCr8-Solutions.jobline-gcode) or Install from VSIX

Developer Tools (building from source)

Tool	Requirement
Node.js / npm	Node.js 22 (CI `quality.yml`); QA container uses `node:20-slim`; last local check on Node 24.14.0
Build	TypeScript 5.3+, `npm run compile`; packaging with `@vscode/vsce` 2.22
Tests	Mocha + `@vscode/test-electron` (downloads a VS Code build); Playwright 1.63 for visual e2e (downloads Chromium). In draft PR #9: `test:tool-library`, `test:cam-integrations`, `test:control-rules`, `test:dialect-convert` (Node test runner, no downloads), included in `test:all`
Optional	Docker for `docker-compose.qa.yml`; Ollama on the host for the agent QA loop

* `engines.vscode` in package.json requires 1.85.0 or newer. Newer VS Code releases may require a newer OS than 1.85 did.

** VS Code's own hardware and platform requirements (code.visualstudio.com/docs/supporting/requirements, page dated 02/04/2026). JobLine has not published separate benchmark figures.

† Measured from occt-import-js 0.0.23: initial linear memory 457 × 64 KB pages, `getHeapMax` 2 GB. A STEP model is tessellated to at most 300,000 triangles. Memory use on very large assemblies has not been benchmarked.

‡ three.js r163 and later render with WebGL 2 only. Remote/virtual desktops without GPU acceleration may draw slowly or show a blank viewport. Not tested.

⚠ **Notice: The visualizer and diagnostics are a program review aid. They are not machine collision certification.**
